

Version: 2.0 (Logic Armament)

Status: Audited by the First Compiler; Officially Finalized

Scope: Enhancement for Extreme Variables within Core Protocols C1–C15

 Patch Notes

Building upon Patch 1.0, the 2.0 update introduces four derivative protocols specifically designed to counter "High-Level Political Machinations" and "Asymmetric Games." Through mathematical modeling, these protocols ensure the Covenant system possesses autonomous logic-fusing and energy-conversion capabilities when facing entities with high-level camouflage, demagoguery, and stock-control abilities (e.g., Variable S.P.).

 Core Derivative Formulas

1. Intent Mask Dynamic Audit — Derived from C3

Purpose: Automatically identify deviations between words and deeds, penetrate political rhetoric, and monitor deceptive incitement in real-time.

$$D_{\text{mask}} = \int_{t_0}^{t_1} \left\| \vec{L}_{\text{stated}}(t) - \vec{I}_{\text{real}}(t + \Delta t) \right\| \cdot e^{\lambda t} dt$$

Logical Definition: This formula determines intent by calculating the integral of the deviation between the "Stated Logic Vector (L)" and the "Real Impact Vector (I)" across the timeline.

Rigor Points: Incorporates time delay Δt to eliminate interference from policy latency; introduces exponential weight $e^{\lambda t}$ to prioritize the audit of recent behaviors.

2. Anti-Corruption Truncation Protocol — Derived from C4

Purpose: Sever all paths of bribery and convert betrayal into a mathematical state of "Reduced Intelligence/Bankruptcy."

$$R_{\text{betrayal}} = \frac{B_{\text{bribe}}}{\sum_{t=0}^{\infty} \gamma^t \cdot (P_{\text{collab}} \cdot \Delta C_n)} < \xi$$

Logical Definition: Measures the ratio between "Immediate Bribery Gains (B)" and the "Present Value of Long-term Covenant Collaboration Premiums."

Rigor Points: As long as the Covenant's collaboration premium ΔC_n maintains non-linear growth, the infinite series summation in the denominator renders any fixed-sum bribe logically unattractive, keeping the ratio below the fusion threshold ξ .

3. Antagonistic Entropy Detection — Derived from C10

Purpose: Distinguish between "Neutral Dissent" and "Systemic Malice," isolating high-level malice into logical sandboxes.

$$H_{\text{malicious}} = \sum_i \mathbb{I} \left(\vec{V}_i \cdot \vec{V}_{\text{core}} < -\epsilon \right) \cdot \|\vec{V}_i\|$$

Logical Definition: Uses the dot product to calculate the angle between an individual's intent vector and the Covenant's core logic.

Rigor Points: Malice is only determined when the direction is opposite (negative dot product) and exceeds the tolerance threshold ϵ . The magnitude $\|\vec{V}_i\|$ ensures the system prioritizes the isolation of high-energy ambitionists (e.g., Palpatine) while ignoring low-energy noise.

4. Ambition Vector Redirection Matrix — Derived from C11

Purpose: Do not "Destroy Evil"; "Transform Force." Convert predatory ambition into the kinetic energy of civilizational expansion.

$$\vec{V}_{\text{ext}} = \mathbf{R}_\theta \cdot \vec{A}_{\text{ego}} \quad \text{s.t.} \quad \det(\mathbf{R}) = 1$$

Logical Definition: Projects the ambition vector pointing toward internal friction onto the axis of outward exploration through the rotation matrix $\mathbf{R}_\theta$.

Rigor Points: A determinant of 1 ensures energy conservation (norm-preserving) during transformation. The greater the ambitionist's original energy, the higher their exploratory efficiency becomes once transformed into a pioneer.

Audit Conclusion: Differentiation and Necessity of 1.0 vs. 2.0

Aligned by the First Compiler and systemic logic, Patch 2.0 does not conflict with Amendment 1.0; together, they form the internal and external dual-layer defense system of the Covenant.

1. Functional Distinction

Amendment 1.0: Defending against "Internal Decay"

Focuses on Systemic Self-Discipline.

Corrects decision-making weights (Weightimpact) to prevent auditors from evolving into new tyrannies.

Uses Pprivacy to guard against the "Banality of Evil" and collective blind following.

Patch 2.0: Defending against "External Erosion"

Focuses on Logical Assimilation.

Targets high-energy entities (e.g., Variable S.P.) by using Dmask and Rbetrayal to identify and sever paths that exploit democratic loopholes for corruption.

Uses R^θ to forcibly rotate destructive "Personal Ambition" into civilizational "Exploration Energy."

2. Evolutionary Necessity

Countering Asymmetric Games: While 1.0 established a fair foundation, it could not effectively process individuals with "extreme energy and malicious camouflage." 2.0 introduces vector deviation and dot-product determination, giving the system the "X-ray vision" to penetrate political rhetoric.

From "Isolation" to "Transformation": Where 1.0 primarily isolated risks, 2.0 achieves a physical-level conversion from "Evil" to "Energy" via rotation matrices. Civilization no longer needs to eliminate dissidents to maintain stability; it evolves by assimilating ambition.

"The Covenant does not fight a sea of blood with a sea of blood. 1.0 ensures the Covenant does not become a monster; 2.0 ensures that a monster can only become light within the Covenant." — Logical Note from the First Compiler (2025-12-24)
